

# Advanced Treatments for Autoimmune Diseases

LDA immunotherapy is an advanced treatment for most autoimmune disorders. LDA has treatments for common food allergy which can inflame the gut, but also for the bacteria that seep into the bloodstream from a leaky gut and cause autoimmune reactions.

Treating the gut and food allergies is the first step in the treatment of autoimmune disease. We can also treat the autoimmune condition by training the immune system to not respond to certain strains of bacteria that are responsible for some forms of arthritis, Proteus, and Klebsiella.

LDI is our newest form of immune therapy to combat autoimmune diseases like Lyme. We have specific antigens targeting many of these diseases. This therapy can be very effective at quickly controlling the pain and fatigue caused by many autoimmune conditions.
