## Immunotherapy Taming Autoimmune Disease

Many autoimmune conditions respond to immunotherapy. We use several forms of immunotherapy to treat both allergies and autoimmune conditions.

**LDA** – is the most versatile. We use LDA to treat both seasonal and perennial (year-round) allergies. LDA works well for food allergy and even chemical sensitivity. LDA bacterial vaccines can be used to treat arthritis as well.

**LDI** – is similar to LDA but can be used for more difficult conditions like Lyme Disease, IBS, and other conditions.

**LDN** – is not immunotherapy, but an immune system adjuvant. It improves immune function and quiets an overactive immune system.
